

# Spool EmPower

## NSK Spooler Report Distribution

### General Overview

Spool EmPower is the most innovative report distribution tool available for NSK. The product is uniquely structured so the end user can choose from several different modules to meet the needs of their environment. Since each module is licensed independently users can combine any number of options.

**E-Mail Module** - Using SMTP or MAPI conventions, distribute reports directly from the spooler straight to a user's e-mail account. It is a secure and timely alternative for many organizations. A "Save to Disk" option is also included with this module.

**FTP Module** - This feature allows the user to send jobs to an FTP server.

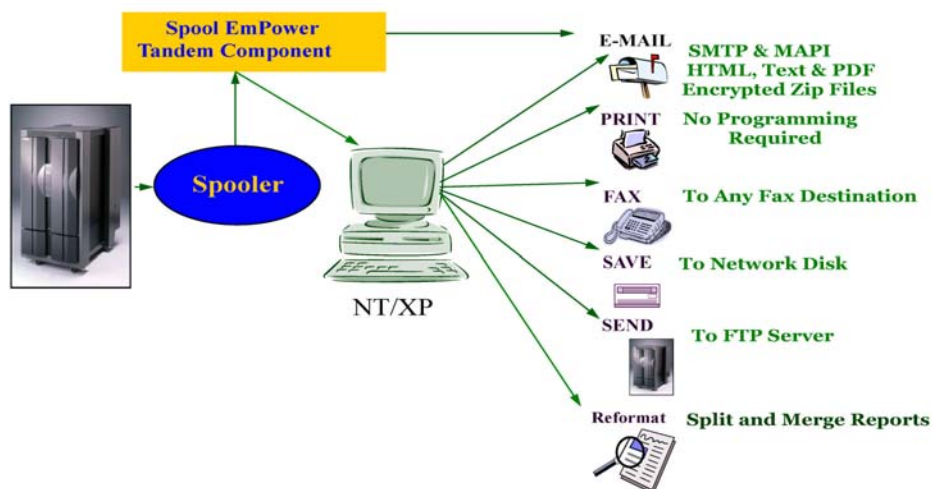

**Print Module** - With the Print Module jobs can be routed from the spooler to any Windows NT/2000/XP supported printer. Options are available to format the font and page orientation, as well as many other features.

**Fax Module** - Any NT/2000/XP supported fax modem in a network can receive jobs directly from the spooler with this module.

**Host Module** - Need an SMTP option that eliminates PC intervention? The Host module will offer just that. SMTP and FTP are the supported modules.

**FTPSERV Module** - Allow any FTP client to connect to the Tandem Spooler thus viewing and managing the spooler as a conventional file system. It's a powerful feature having the ability to text search through the spooler looking for a specific data string.

**Reformat Module** - The ability to extract and reformat certain lines and or columns of data is possible with this module. After this is complete use one of the above options to deliver your newly created report.
